

LendWell

LendWell's Head of Credit Risk wants to reduce the bank's loan default rate for the coming financial year.

She has asked you, as a Data Analyst, to review the attached loan applicant dataset and provide insights to support the Credit Risk team in meeting this objective.

The dataset contains applicant demographic details, income, employment history, loan characteristics, credit history, and the loan outcome (default vs. paid).

Please prepare a 20-minute presentation covering the following:

- What factors are most strongly associated with loan default?
- How do applicant profile (age, income, education, employment experience) and loan characteristics (amount, interest rate, % of income) relate to default risk?
- Which applicant segments carry the highest risk, and which carry the lowest?
- What lending criteria or policy changes would you recommend to reduce defaults while still growing the loan book?
